Distribution - Regent University

A discrete probability distribution is applicable to the scenarios where the set of possible outcomes is discrete (e.g. a coin toss or the roll of a dice), and the probabilities are here encoded by a discrete list of the probabilities of the outcomes, known as the probability mass function.

Key Results: x and $P(X = x)$ for a discrete distribution In these results, the probability density values are given for a binomial distribution with 4 trials and event probability of 0.10. For example, the probability that one event occurs in 4 trials is 0.2916, and the probability that 4 events occur in 4 trials
